## I. INTRODUCTION

Acetylcholinesterases (AChEs) are enzymes that hydrolyze the neurotransmitter acetylcholine (ACh) to and choline. AChE is located at the synaptic cleft and functions to terminate synaptic transmission by catalyzing the breakdown of ACh allowing cholinergic neurons to return to a resting state after activation. Changes in AChE activity may result from exposure to certain insecticides, which act as cholinesterase inhibitors. Inhibitors of AChE are also used to treat certain conditions such as dementia.

Acetylcholinesterase ActivityColorimetric Microplate Assay Kit provides a simple and direct procedure for measuring AChE levels in a variety of samples such as blood, serum, and plasma. In this assay, thiocholine produced by AChE, reacts with DTNB to form an colorimetric (412 nm) product (TNB), proportional to the AChE activity present.

## II.KIT COMPONENTS

| Component          | Volume    | Storage            |
|--------------------|-----------|--------------------|
| 96-Well Microplate | 1 plate   |                    |
| Assay Buffer       | 30 mlx 4  | 4 °C               |
| Reaction Buffer    | 20 ml x 1 | 4 °C               |
| Substrate          | Powderx 1 | 4 °C, keep in dark |
| Dye Reagent        | Powderx 1 | 4 °C, keep in dark |
| Standard           | Powderx 1 | 4 °C               |
| Positive Control   | Powderx 1 | -20 °C             |
| Technical Manual   | 1 Manual  |                    |

### **III. MATERIALS REQUIRED BUT NOT PROVIDED**

1. Microplate reader to read absorbance at 412 nm
2. Distilled water
3. Pipettor, multi-channel pipettor
4. Pipette tips
5. Mortar
6. Centrifuge
7. Timer
8. Ice
9. Ethanol

#### IV. REAGENT PREPARATION

**Standard:** Briefly centrifuge prior to opening. Dissolve in 1 ml distilled water to generate 20 mmol/L of standard stock solution, store at -20°C for 1 month after reconstitution. Then dilute to 5 mmol/L standard top solution by adding 250 µl stock solution into 750 µl distilled water. Perform 2-fold serial dilutions of the top standard solution using distilled water to make the standard curve. The concentration of standard curve could be 5/2.5/1.25/0.625/0.312/0.156/0.078 mmol/L.

**Substrate:** Briefly centrifuge prior to opening. Add 1 ml distilled water to dissolve before use; store at 4 °C for 1 month after reconstitution.

**Dye Reagent:** Briefly centrifuge prior to opening. Add 1 ml ethanol to dissolve before use; keep in dark and store at 4 °C for 1 week after reconstitution.

**Positive Control:** Briefly centrifuge prior to opening. Add 1 ml Assay Buffer to dissolve before use; store at -80 °C for a month after reconstitution.

**Note:** Divide into small aliquots to avoid repeated freeze-thaw cycles.

## **V. SAMPLE PREPARATION**

### **1. For cell and bacteria samples**

Collect cell or bacteria into centrifuge tube, discard the supernatant after centrifugation, add 1 ml Assay Buffer for  $5 \times 10^6$  cell or bacteria, sonicate (with power 20%, sonicate 3s, interval 10s, repeat 30 times); centrifuged at 4000g 4°C for 20 minutes, take the supernatant into a new centrifuge tube and keep it on ice for detection.

### **2. For tissue samples**

Weigh out 0.1 g tissue, homogenize with 1 ml Assay Buffer on ice, centrifuged at 4000g 4°C for 20 minutes, take the supernatant into a new centrifuge tube and keep it on ice for detection.

### **3. For serum or plasma samples**

Detect directly.

## VI. ASSAY PROCEDURE

Warm Reaction Buffer to room temperature before use.

Add following reagents into the microplate:

| Reagent*                                                       | Sample** | Control | Standard | Blank | Positive Control |
|----------------------------------------------------------------|----------|---------|----------|-------|------------------|
| Reaction Buffer                                                | 170µl    | 170µl   | 170µl    | 170µl | 170µl            |
| Substrate                                                      | 10 µl    | 10 µl   | --       | --    | 10 µl            |
| Sample                                                         | 10 µl    | --      | --       | --    | --               |
| Distilled water                                                | --       | 10 µl   | 10 µl    | 20 µl | --               |
| Standard                                                       | --       | --      | 10 µl    | --    | --               |
| Positive Control                                               | --       | --      | --       | --    | 10 µl            |
| Dye Reagent                                                    | 10 µl    | 10 µl   | 10 µl    | 10 µl | 10 µl            |
| Mix, wait for 2 minutes, record absorbance measured at 412 nm. |          |         |          |       |                  |

### Note:

\*Reagents must be added sequentially and should not be premixed prior to addition.

\*\*For unknown samples, we recommend doing a pilot experiment & testing several doses to ensure the readings are within the standard curve range. If the enzyme activity is lower, please add more samples into the reaction system; or increase the reaction time; if the enzyme activity is higher, please dilute the sample, or decrease the reaction time.

\*\*For colored samples, we recommend setting a parallel sample background control well with same volume of sample only. Other reagents were replaced by distilled water to the same total volume. Subtract the OD value of the sample background control from the OD value of the sample to correct for interference from the sample's own color.

## VII. CALCULATION

**Unit Definition:** One unit of AChE activity is defined as the enzyme hydrolyze 1 $\mu$ mol of Acetylthiocholine iodide per minute at 25°C and pH 7.4.

1. According to the slope of the standard curve

$$\text{Activity} = \frac{(\text{OD}_{\text{Sample}} - \text{OD}_{\text{Control}}) - \text{Intercept}}{\text{Slope} \times T} \times n (\text{U/mL})$$

2. According to one point of the standard OD value and concentration

2.1 According to the protein concentration of sample

$$\text{Activity} = \frac{(C_{\text{Standard}} \times V_{\text{Standard}}) \times (\text{OD}_{\text{Sample}} - \text{OD}_{\text{Control}})}{(\text{OD}_{\text{Standard}} - \text{OD}_{\text{Blank}}) \times V_{\text{Sample}} \times C_{\text{Protein}} \times T} (\text{U/mg})$$

2.2 According to the quantity of cells or bacteria

$$\text{Activity} = \frac{(C_{\text{Standard}} \times V_{\text{Standard}}) \times (\text{OD}_{\text{Sample}} - \text{OD}_{\text{Control}})}{(\text{OD}_{\text{Standard}} - \text{OD}_{\text{Blank}}) \times N \times (V_{\text{Sample}} / V_{\text{Assay}}) \times T} (\text{U}/10^4)$$

2.3 According to the weight of sample

$$\text{Activity} = \frac{(C_{\text{Standard}} \times V_{\text{Standard}}) \times (\text{OD}_{\text{Sample}} - \text{OD}_{\text{Control}})}{(\text{OD}_{\text{Standard}} - \text{OD}_{\text{Blank}}) \times W \times (V_{\text{Sample}} / V_{\text{Assay}}) \times T} (\text{U/g})$$

2.4 According to the volume of sample

$$\text{Activity} = \frac{(C_{\text{Standard}} \times V_{\text{Standard}}) \times (\text{OD}_{\text{Sample}} - \text{OD}_{\text{Control}})}{(\text{OD}_{\text{Standard}} - \text{OD}_{\text{Blank}}) \times V_{\text{Sample}} \times T} (\text{U/mL})$$

Slope: the absorbance slope of standard curve

n: the dilution factor

C<sub>Protein</sub>: the protein concentration of sample, mg/mL

W: the weight of total sample, g

N: the quantity of total cell or bacteria sample, 10<sup>4</sup>

C<sub>Standard</sub>: the concentration of standard, mmol/L=  $\mu$ mol/mL

V<sub>Standard</sub>: the volume of standard in assay procedure, mL

V<sub>Sample</sub>: the volume of sample in assay procedure, mL

$V_{\text{Assay}}$ : the volume of Assay Buffer in sample preparation, mL

T: the reaction time, minute

## VIII. TYPICAL DATA

The standard curve is for demonstration only. A standard curve must be run with each assay.

Detection Range: 0.1 mmol/L - 5 mmol/L

Positive Control reaction in 96-well plate assay with decreasing the concentration
